

Final Report: User Feedback Insights and Recommendations for Fintech Apps

Executive Summary & Objectives

This report presents a comprehensive analysis of over 1,000 user reviews collected from several mobile banking applications in Ethiopia, including those of Commercial Bank of Ethiopia (CBE), Bank of Abyssinia (BOA), and Dashen Bank. The primary objective of this analysis is to uncover key drivers of user satisfaction, identify recurring pain points, and offer actionable recommendations to improve the overall user experience of these digital financial platforms.

By applying natural language processing (NLP) techniques such as **sentiment analysis**, **keyword extraction**, and **theme classification**, we systematically categorized user feedback into meaningful insights. The analysis reveals the most valued app features—such as speed, simplicity, and ease of use—as well as common user frustrations related to crashes, login difficulties, and delayed customer support.

Additionally, we compared user sentiment across different banks to identify relative strengths and weaknesses. For instance, BOA's app received notably positive feedback for its interface speed and intuitive navigation, while CBE users reported frequent technical issues. Dashen Bank showed a balance of positive and negative feedback, indicating both strengths and areas needing enhancement.

Based on the findings, we recommend several product improvements, including enhanced error handling mechanisms, a simplified login process, and the integration of budgeting tools to increase user engagement. We also highlight the need for improved customer support responsiveness to reduce frustration and user churn.

Lastly, we acknowledge potential biases in online reviews, such as the tendency for users to post mainly when dissatisfied, and emphasize the importance of continuous feedback monitoring for more accurate product evaluation.

Overall, this report aims to support banks and fintech developers in making **data-driven decisions** to enhance digital banking experiences and customer satisfaction.

Objectives:

- Identify top satisfaction drivers and pain points in user feedback.
- Compare user sentiment across different banks.
- Provide actionable recommendations to improve app features.
- Visualize insights to support data-driven decisions.

Page 2: Data Insights & Comparisons

Satisfaction Drivers:

Driver	Supporting Keywords
Fast performance	"fast", "quick", "responsive", "easy"
User-friendly design	"simple", "easy to use", "convenient"

Example: “The app is very fast and simple to navigate.” – CBE user

Pain Points:

Pain Point	Supporting Keywords
App crashes & bugs	"crash", "freezes", "not working"
Login/access issues	"can't login", "password error"

Example: “App always crashes when I try to open it.” – BOA user

Bank Comparison:

- **CBE:** Higher number of positive sentiments. Praised for speed and reliability.
- **BOA:** Mixed reviews. Complaints about frequent app crashes and login problems.

Page 3: Visualizations

1. **Sentiment Distribution per Bank:** Bar plot of positive, and negative reviews by bank.

2. **Top Keywords Word Cloud (CBE):** Highlights common words like "work", "good", "fast".

3. **Theme Frequency Bar Chart:** Displays frequency of themes such as UI/UX, Transaction, etc.

Page 4: Recommendations, Ethics & Git Workflow

Recommendations:

1. **Fix App Stability Issues:** Focus on crash reports, especially for BOA.
2. **Improve Login System:** Address frequent access-related complaints.
3. **Introduce Budgeting Tools:** Add spending insights and alerts.
4. **Enhance Amharic Support:** Translate UI and support more accurately.

Ethical Considerations:

- **Review Bias:** Negative reviews are more likely to be posted.
- **Coverage Disparity:** Some banks have fewer reviews.
- **Language Translation Risks:** Amharic reviews may lose tone in English.
